

How can we take restoration priorities identified using a watershed-based planning tool and link them back to the regulatory process?

1. *Understand* type and extent of potential *project impacts* at the site-scale
2. *Understand* the condition of *key ecological processes* at landscape scales
3. *Identify sites* capable of matching #1 with #2 above
4. *Target sites maximizing long-term environmental benefits*

Target mitigation for maximum benefits

Target landscape, not artificial, storage and treatment

Engineered Flow Control

Example, stormwater detention pond

**No benefits beyond water
quality/quantity**

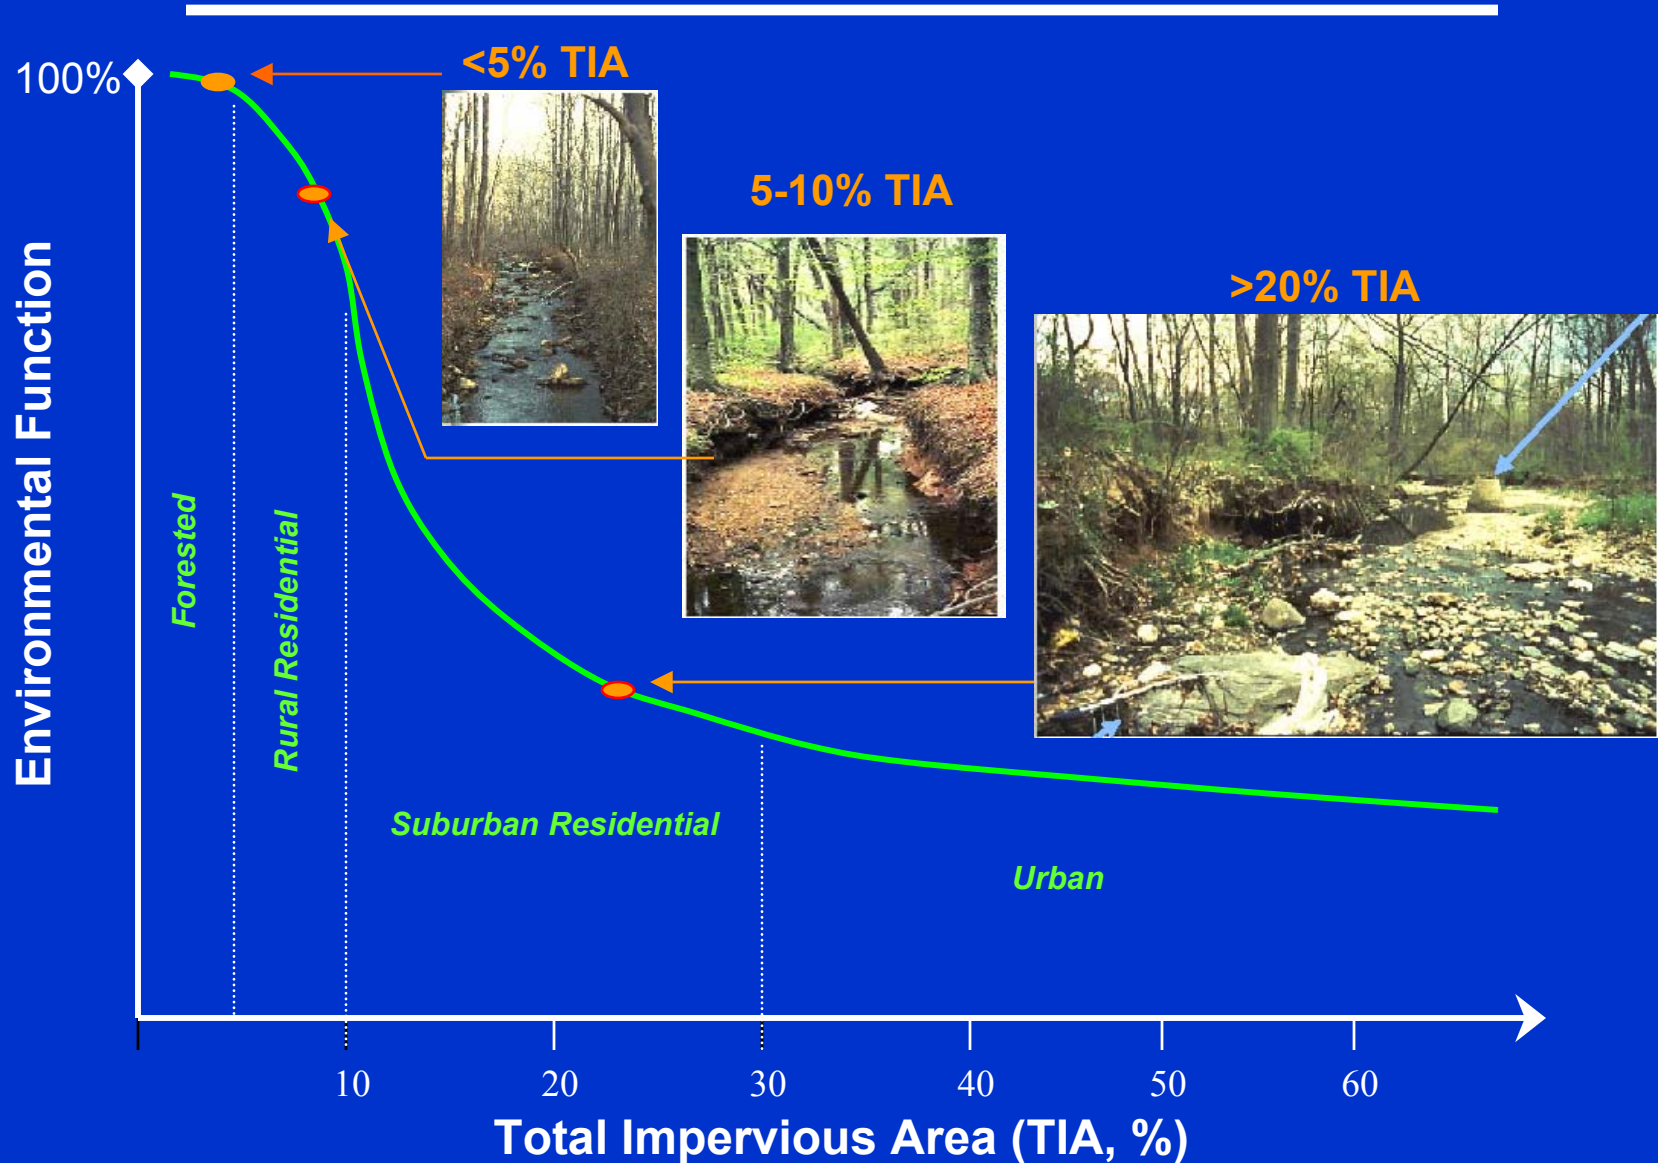

Restoring Natural Control

Example: wetlands restoration

**Many benefits beyond just water
quality/quantity**

Target mitigation where it's most effective

Characterize Condition of
Target Ecological Processes

Target Key Areas for
Recovery

Translate
landscape
processes
back to site
functions

Assess mitigation potential
type, area, function

Watershed-scale

Site-scale

Translate site
functions to
landscape
processes

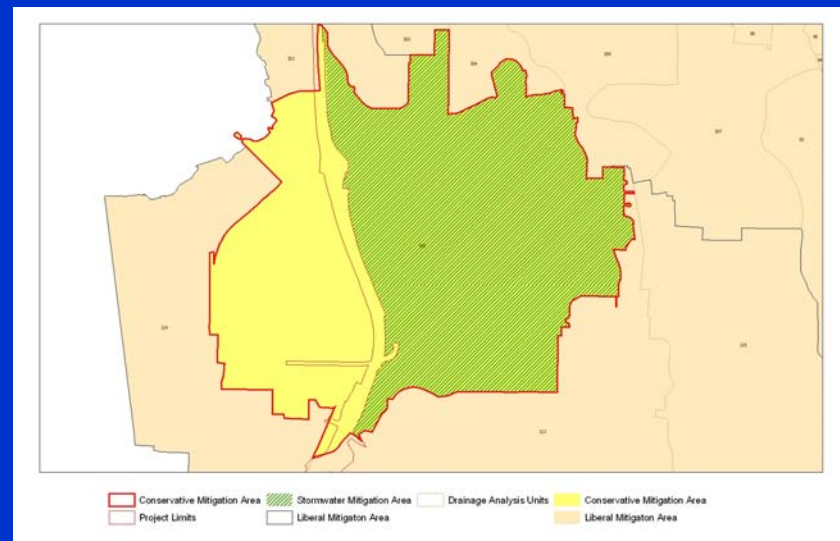

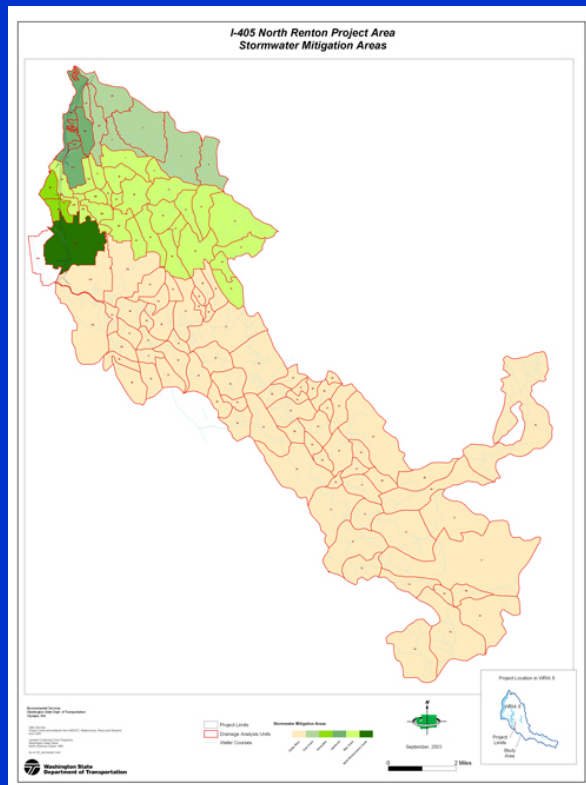

Assess project impacts
type, area, function

I-405 North Renton Study Area

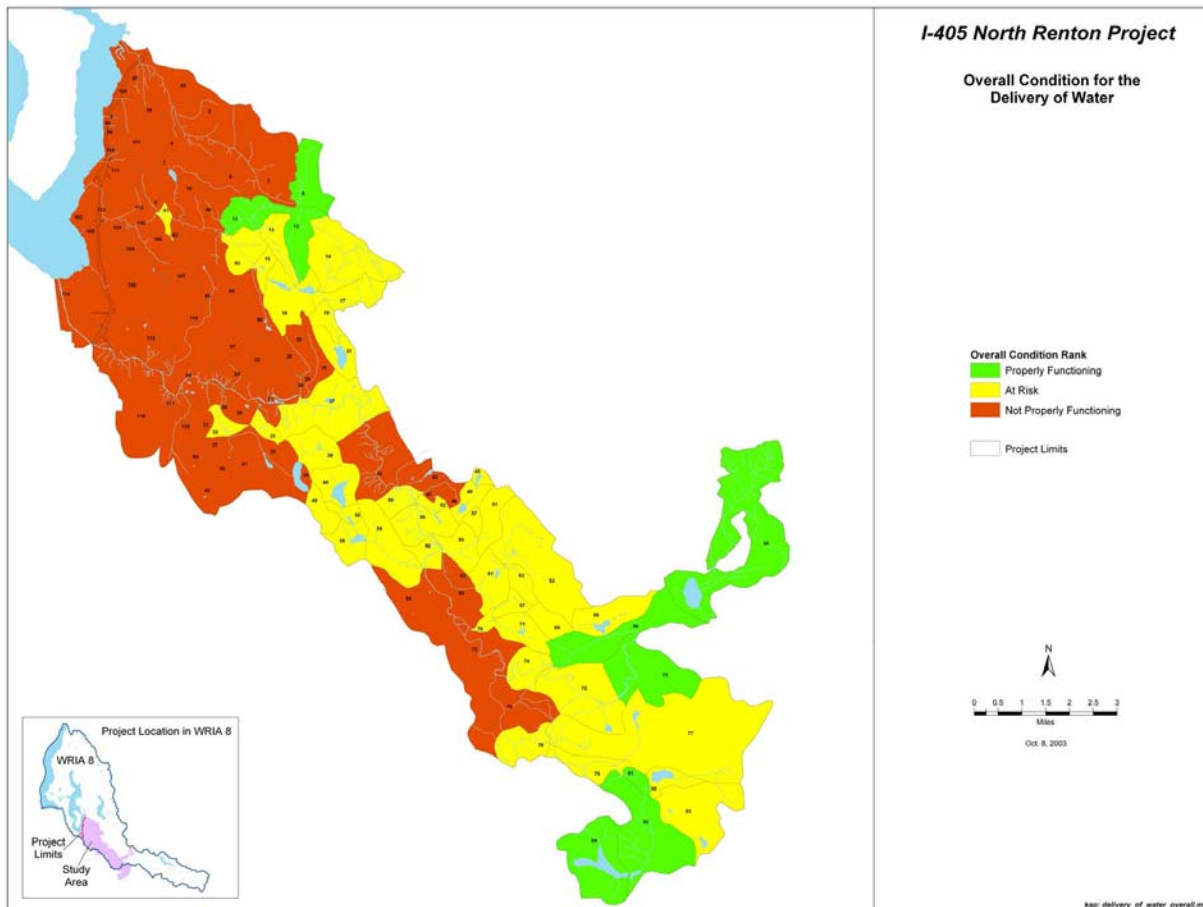

Establish Spatial Scales for Analysis and Mitigation

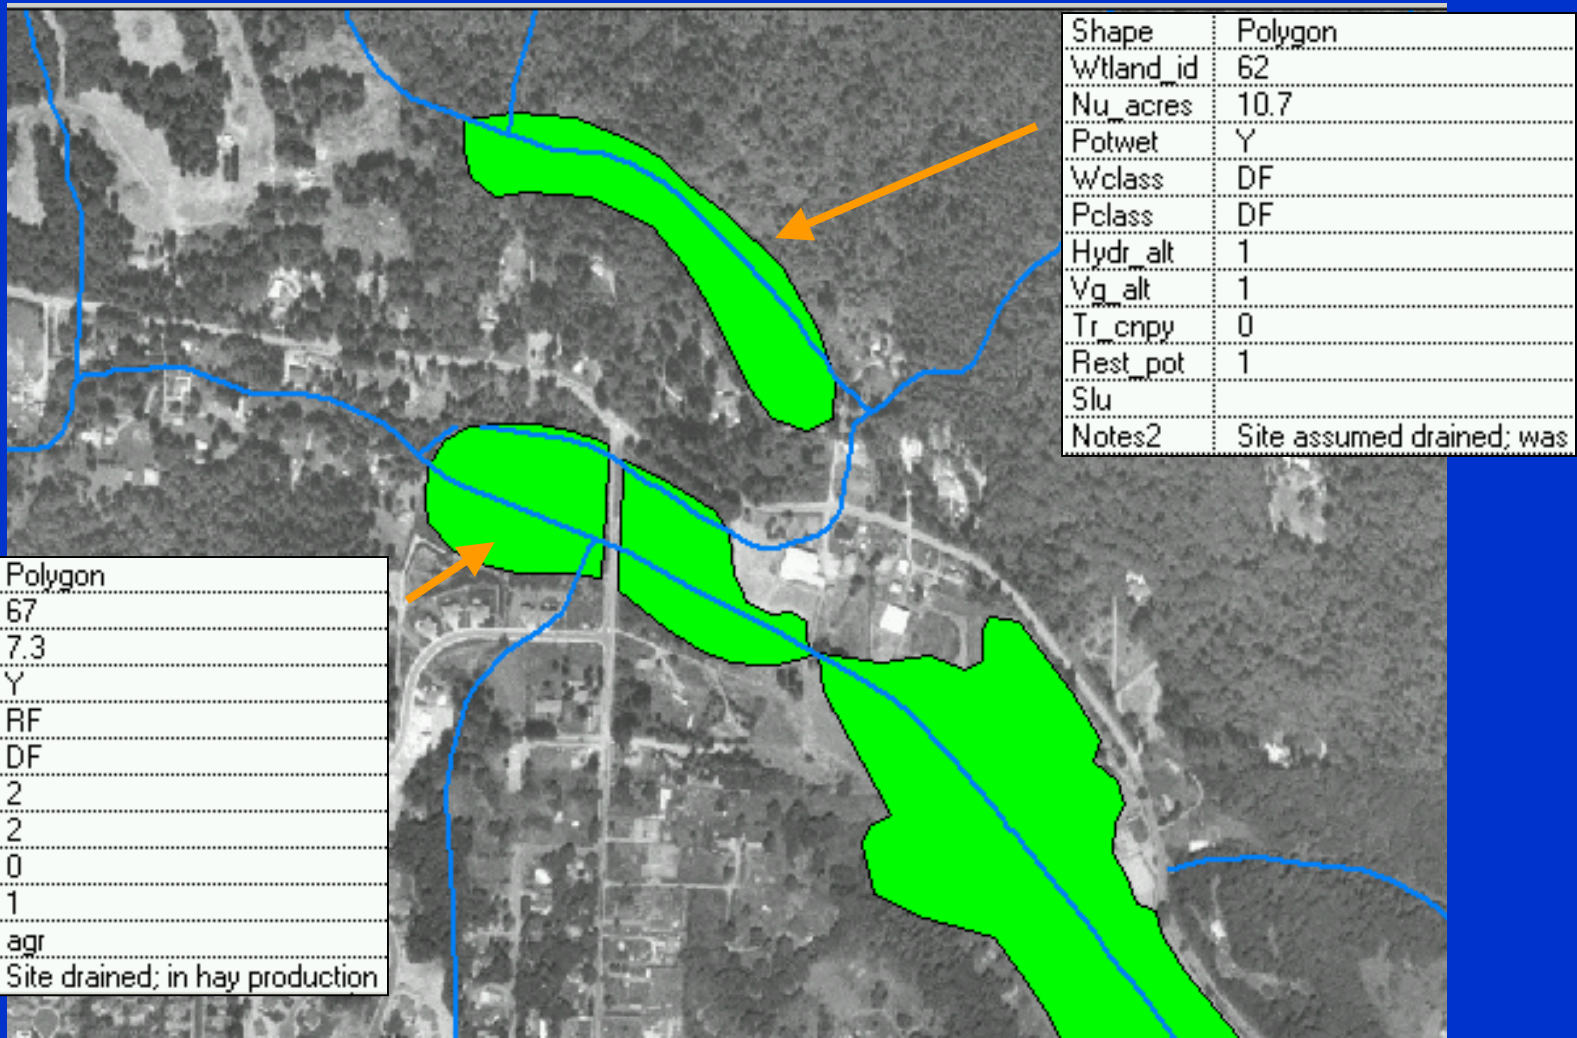

Interstate 405, North Renton

Characterize Condition of Study Area

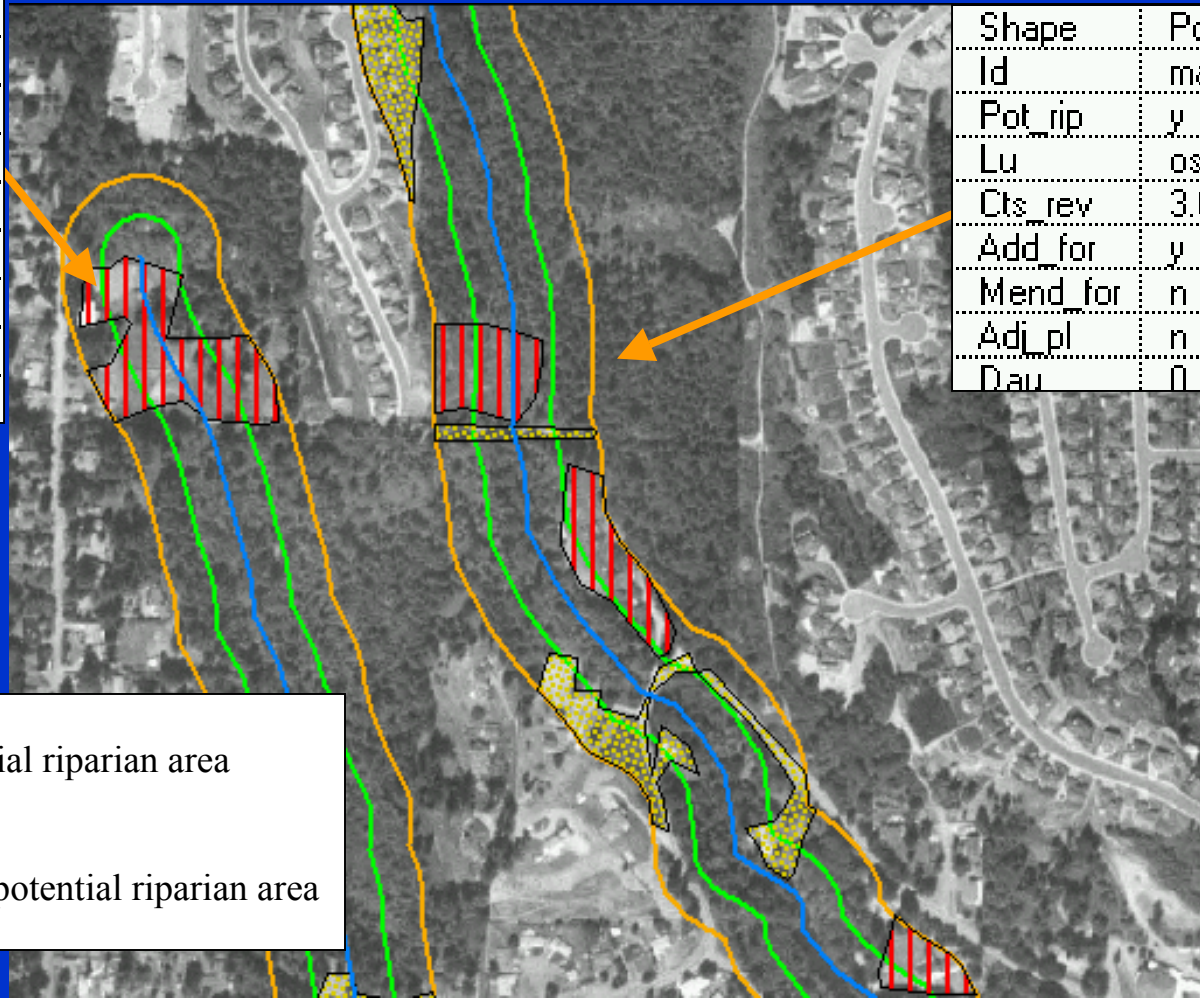

- *Water*
- *Sediment*
- *Pollutants*
- *Wood*
- *Heat*
- *Aquatic Integrity*
- *Upland Integrity*

May Creek Site Locations

I-405 North Renton Project Priority Candidate Stormwater Mitigation Sites - May Creek

What challenges and opportunities did this present?

Challenges

- Multiple levels of environmental regulation
- Foundational elements to coordinated watershed planning don't exist
- Some permitting agencies embrace change best when *they* recommend the changes
- Overcoming internal and external prejudices (a.k.a. change is hard)
- Cooperation with some local jurisdictions

Opportunities

- People get excited about watershed work
- We provide project engineers with new options that they didn't have before
- New landscape data and perspectives provide opportunities to share data and develop new relationships
- Random acts of management doesn't work
