

Using Business Objects and Web Intelligence to Inform Water Quality Assessment Decisions

Robert Voss

Missouri Department of Natural Resources

Data Management Tools Session

The National Water Quality Data Management Training Workshop

May 31, 2017

Problem

- How can we speed up and our assessment process while allowing for flexible automation.
- Solution: SAP Business Objects – Web Intelligence
 - Web Based Reporting tool that our IT implemented and maintains.
 - Customizable reporting that includes conditional formatting and formula writing, and input controls
 - Based on our data management system
 - This cut our assessment time by at least 50% if not more. It also decreases training time for new staff. Went from average of 120 days to 44 days.

Context

- 4300+ Assessment Units
- 2,000,000+ Data Points
- 3 Staff
- Assess Streams and Reservoirs

Process

- How has the tool / process improved workflow?
 - Semi-Automated
 - Only internal data. We use external data but import it into our system.
 - Human element
 - Manual selection of AU to be assessed
 - Can pick and choose the following to use in assessment via input controls
 - Sites, sample numbers, dates, parameters, organization, QC, etc. pretty well anything tied to the sample data.
 - Once selections are made formatting and organizing of data is automatic
 - Conditional formatting to highlight exceedances, new data, etc.
 - Includes mathematical and logical formulas, can pass formulas to excel
 - Eg. Counts, means, geomeans,
 - Output to Excel or PDF
 - Most QC of data should be done before assessments, but small amount of QC for duplicate samples, Upstream/Downstream comparisons, the “exceptions”, etc.

Process

- Is the tool available for use?
 - Not open source, but should be implementable through most IT programs by their database management staff.
 - Used for auto generating 303(d) list and delist.
 - Summarizing pollutants and sources
 - Used for calculating 305(b) stats
 - Can be utilized for other programs as well
 - Eg. Permits and Compliance/Enforcement use it as well.
- Saves Time
 - Tool does 95% of the time consuming tedious, repetitive tasks
 - Allows us to more effectively organize data to analyze it in different ways
 - Can group, create sections, and create breaks in the data and summarize for each
 - Eg. Can choose which sites to group together for an U/D comparison then create sections of the data and have summary statistics calculated for each automatically.
 - The tool reports all media types at one time for each AU and also generates a summary of the available data and AU status from last assessment cycle

*Sample is the average of two or more duplicate samples.

Dissolved Oxygen

The water quality standard for Dissolved Oxygen (for the protection of warm water habitat and cool water habitat) is 5.0 mg/L as a minimum. The water quality standard for Dissolved Oxygen (for the protection of cold water habitat) is 6.0 mg/L as a minimum. The water quality standard allows no more than ten percent of the samples to fall below either 5.0 mg/L or 6.0mg/L depending on the applicable use. To account for Type One and Type Two Errors we use the Binomial Probability formula to give us a Type One Error rate. The minimum allowable error rate is 0.1; a stream would be judged as impaired if the Type One error rate is less than 0.1.

Total Number of Exceedances: Total Number of Samples:

The Binomial Probability Type One Error Rate is: Thus Barn Hollow is judged as impaired for Dissolved Oxygen

Bacteria

Baynham Br. is a Class B Whole Body Contact recreational water with an E. coli standard of 206 colonies/100 ml. This standard is interpreted as the geometric mean of at least five samples taken during the recreational season, April 1 to October 31, of any given year. A water body is judged to be impaired if the standard is exceeded in any of the last three years for which there is adequate data. Baynham Br. is also a Secondary Contact recreational water with an E. coli standard of 1134 colonies/100 ml. This standard is interpreted as the geometric mean of at least five samples taken during the recreational season, April 1 to October 31, of any given year. A water body is judged to be impaired if the standard is exceeded in any of the last three years for which there is adequate data. Baynham Br. has exceeded one or both criterion at least once in the last three years of available data. Thus Baynham Br. is judged as impaired for Escherichia coli.

Lesson Learned

- We thought automation was not manageable, but with the right tools, a certain level of automation is possible and that automation can be flexible and customizable.

Robert Voss
