Pennsylvania's Continuous Physiochemical Assessment Method

Data Collection

PVC chute on rock outcrop in middle of
Susquehanna River

- Few long-term continuous sites
- No telemetry

- Unique deployments
- Middle channel measurements

Suspended off bottom in high
deposition environment

Lots of Sites

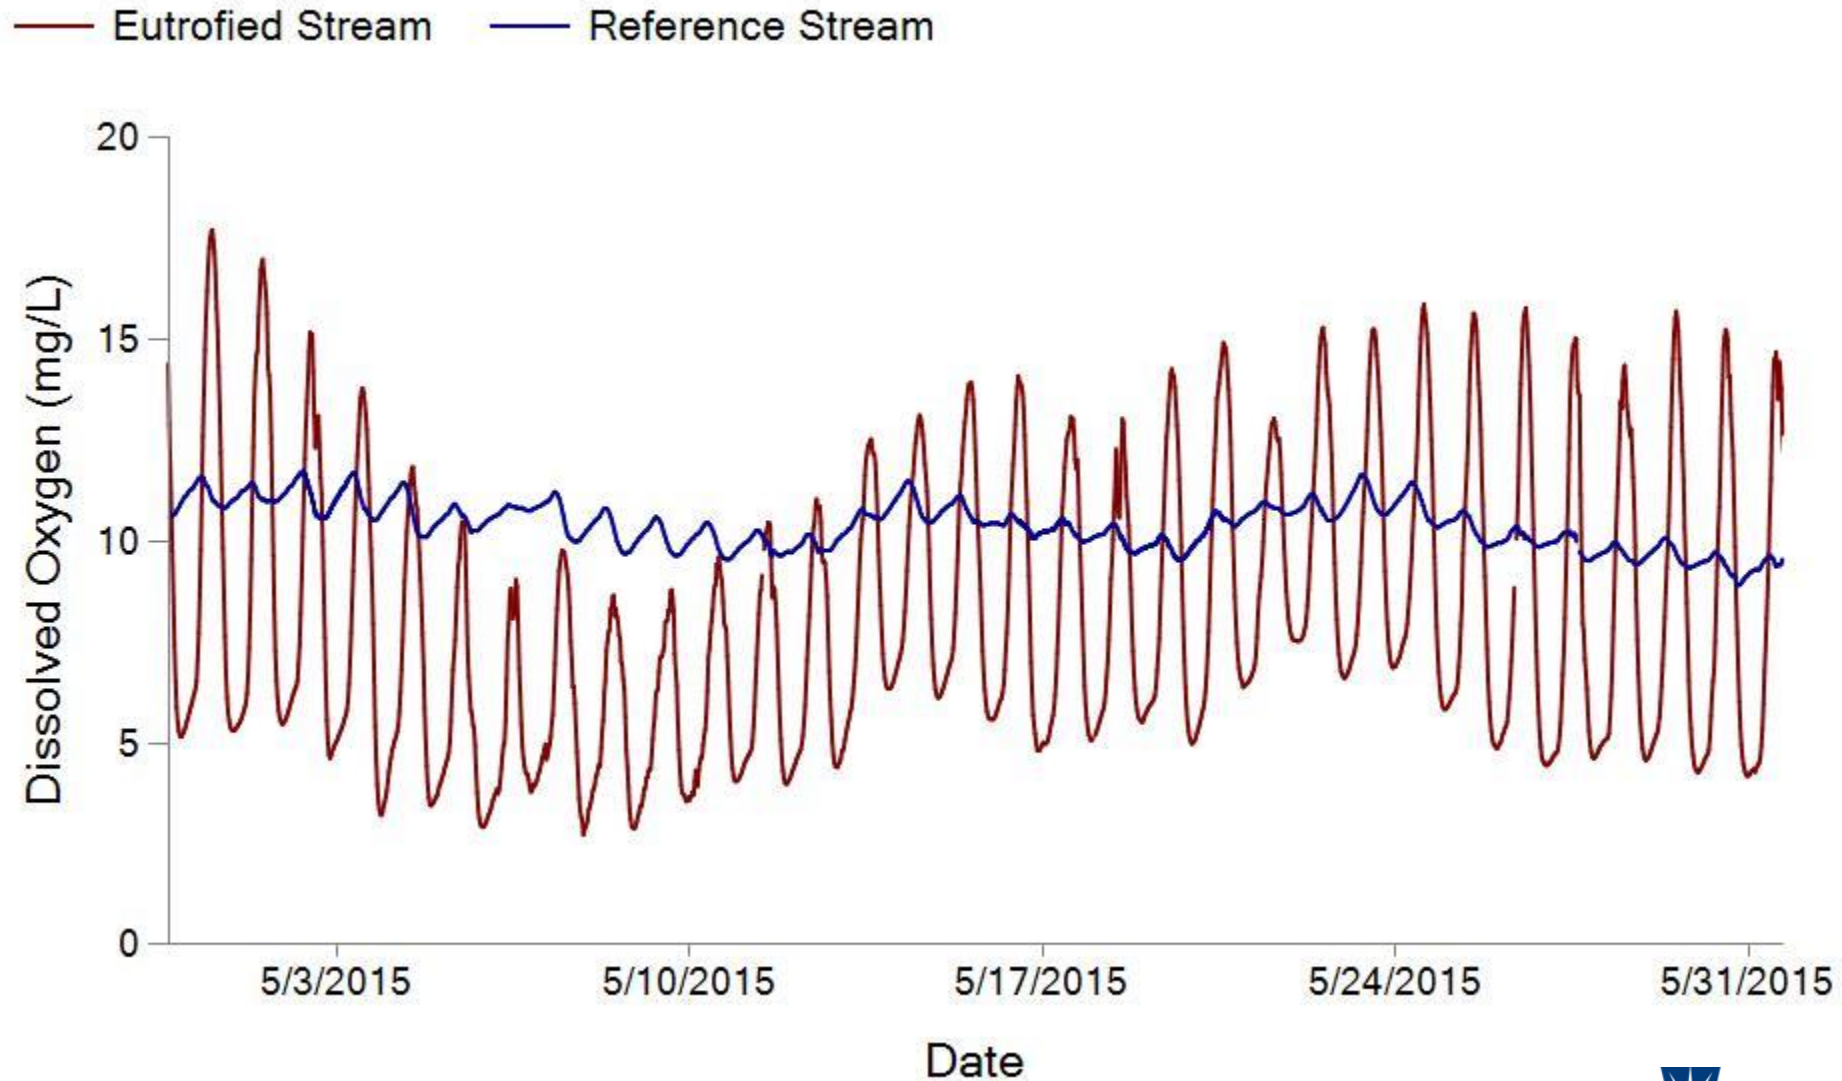

QA/QC Requirements

- Regular fouling and calibration checks
- Discrete readings with independent meter
- Corrections and removal of “bad” data
- Cross-section transects to ensure data are representative.

Uses of Continuous Data

- Characterize background/historic conditions
- Cause and effect studies
- Assessments using established ALU and PWS criteria
- Eutrophication cause determination

Uses: Eutrophication Cause Determination

Water Quality Standards

§93.7(a), Table 3

- pH: 6.0 - 9.0 units
- Dissolved Oxygen: minimum 5.0 mg/L

Model-derived parameters

- Examples: osmotic pressure (ALU), TDS (PWS)
- Account for uncertainty in model

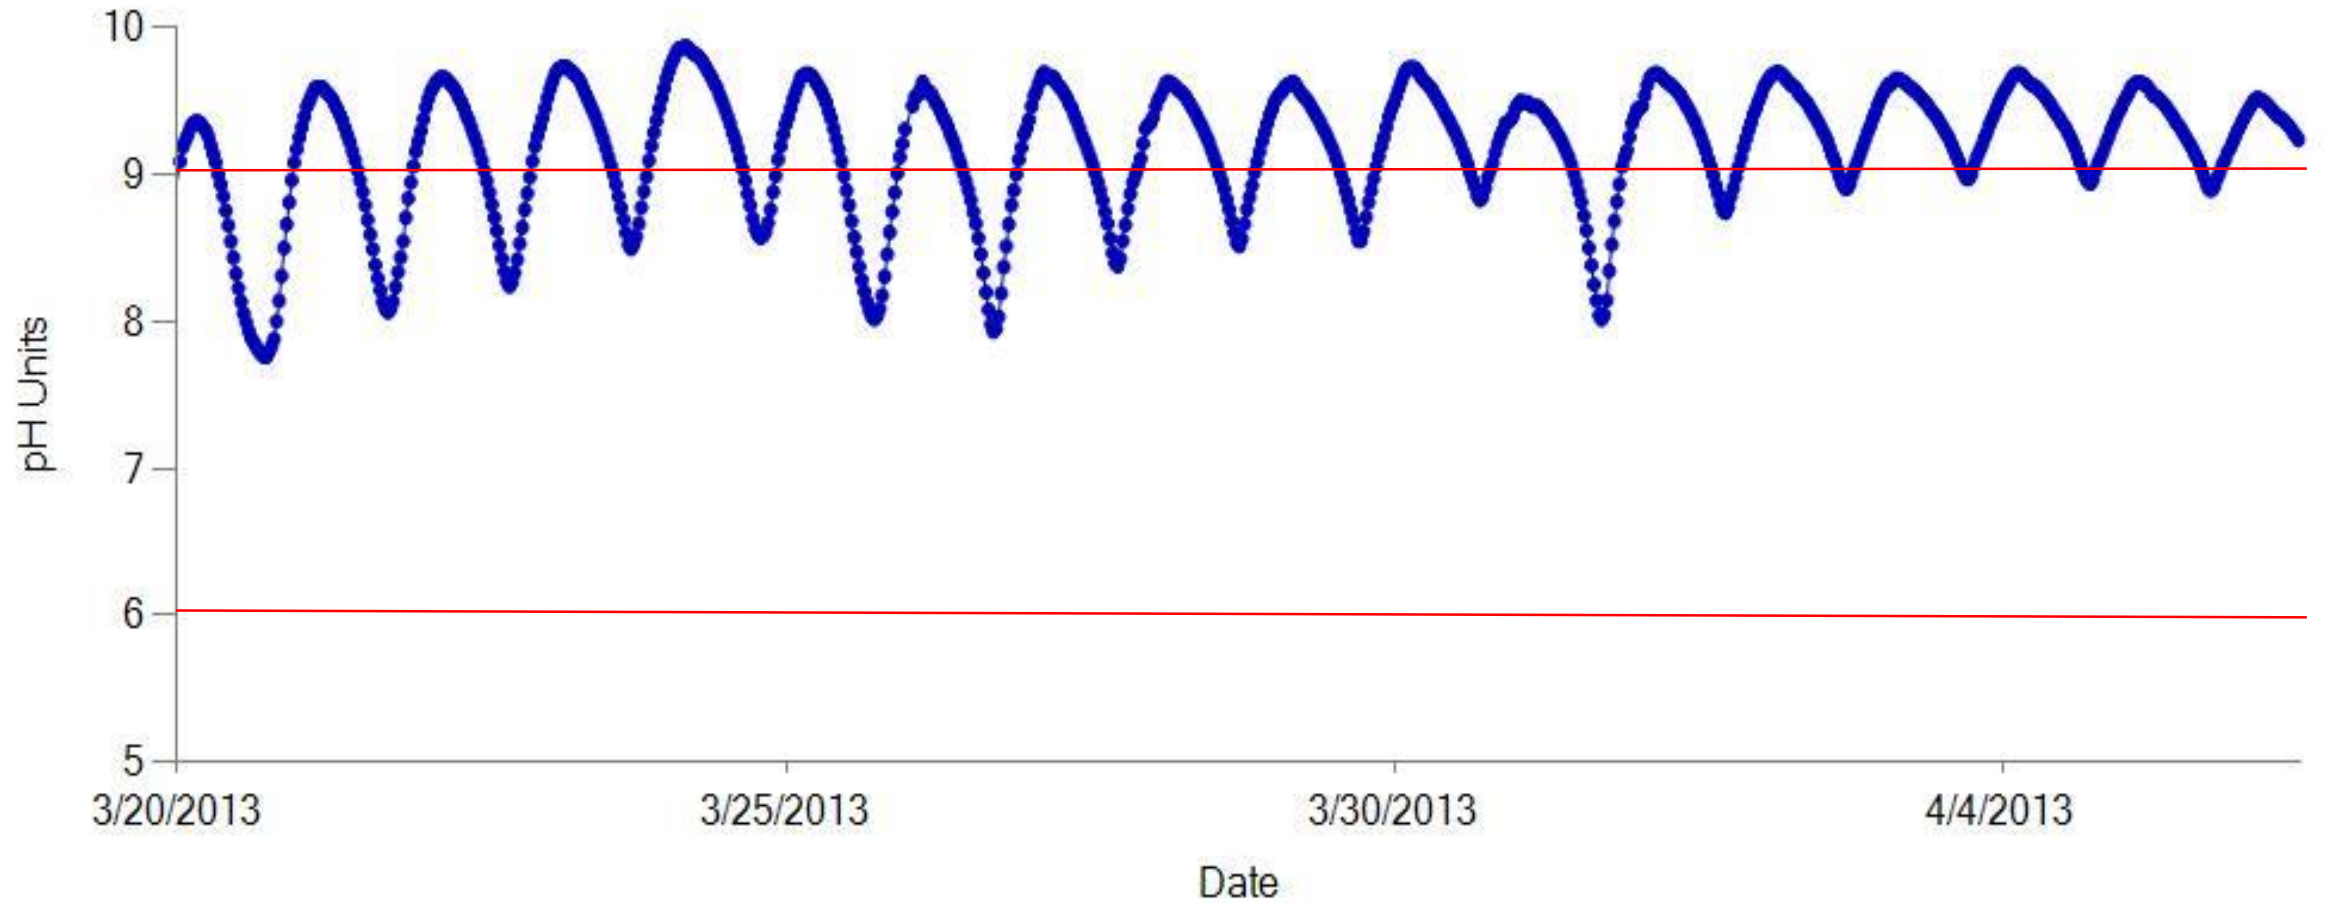

99% Rule

§96.3(c): “[criteria] shall be achieved in all surface waters at least 99% of the time”

Discrete samples

- Sample represents 1 day
- 4 samples = violation (4 days / 365 days = 1.1%)

Count Exceedances

99% with CIM

$$\%Y=100 \left[\frac{n * i}{k} \right]$$

Interval	# Readings > 1% of Year
15 min	351
30 min	176
60 min	88

Critical Periods

- Open canopy vs closed
- Pre- vs post-leaf emergence

- Solubility of oxygen

- Moderates conditions
- Scour of photosynthetic organisms

Annual Variation

Summer Discharge of Susquehanna River at Harrisburg 2013-16

Source: USGS Station 01570500

← 2018

Model-Derived Parameters

Specific Conductance

Temperature

Turbidity

Streamflow

Julian-day

Actinomyces

Alkalinity

Atrazine

Bicarbonate

Boron

Calcium

Chloride

Dissolved nitrate

Dissolved nitrate + nitrite

Dissolved orthophosphorus

Dissolved phosphorus

Dissolved solids

E. coli

Enterococci bacteria

Fecal coliform bacteria

Fluoride

Hardness

Magnesium

Particulate phosphorus

Sodium

Sulfate

Suspended sediment

Total nitrogen

Total organic carbon

Total organic N + NH₃

Total phosphorus

Total suspended solids

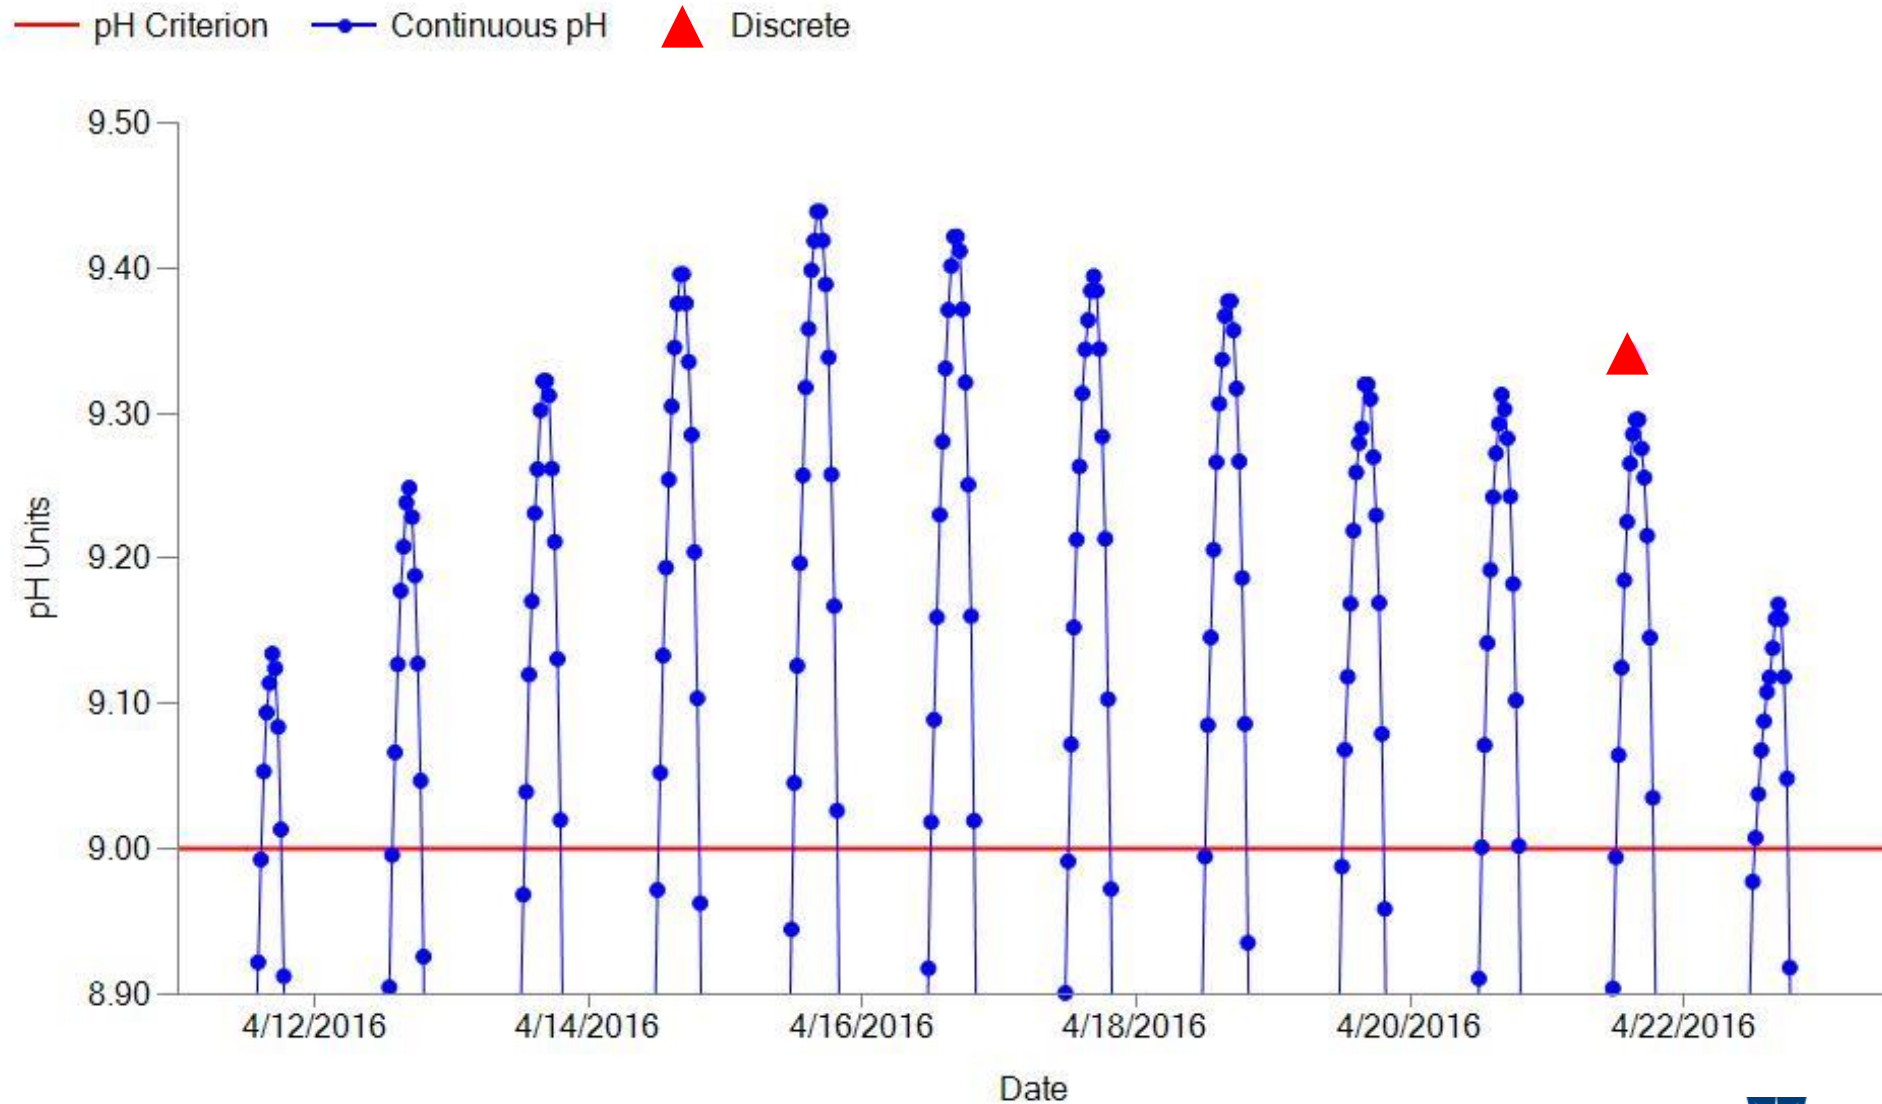

Model-Derived Parameters

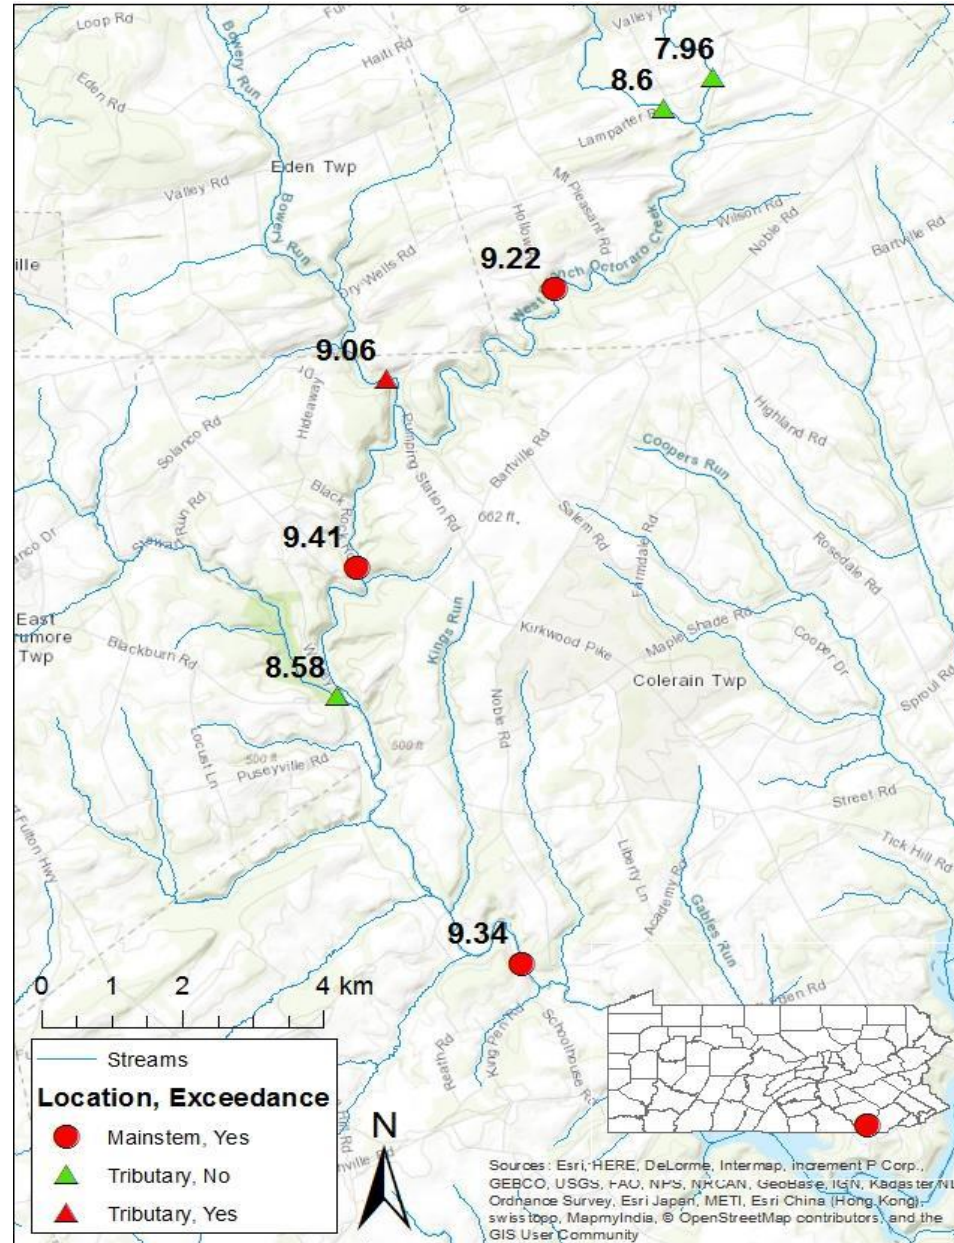

- EPA supported
- USGS guidelines
- Discrete samples
 - Over-top of sonde
 - Cover range of values
- Site specific

Probability of Exceedance \geq ***90%***

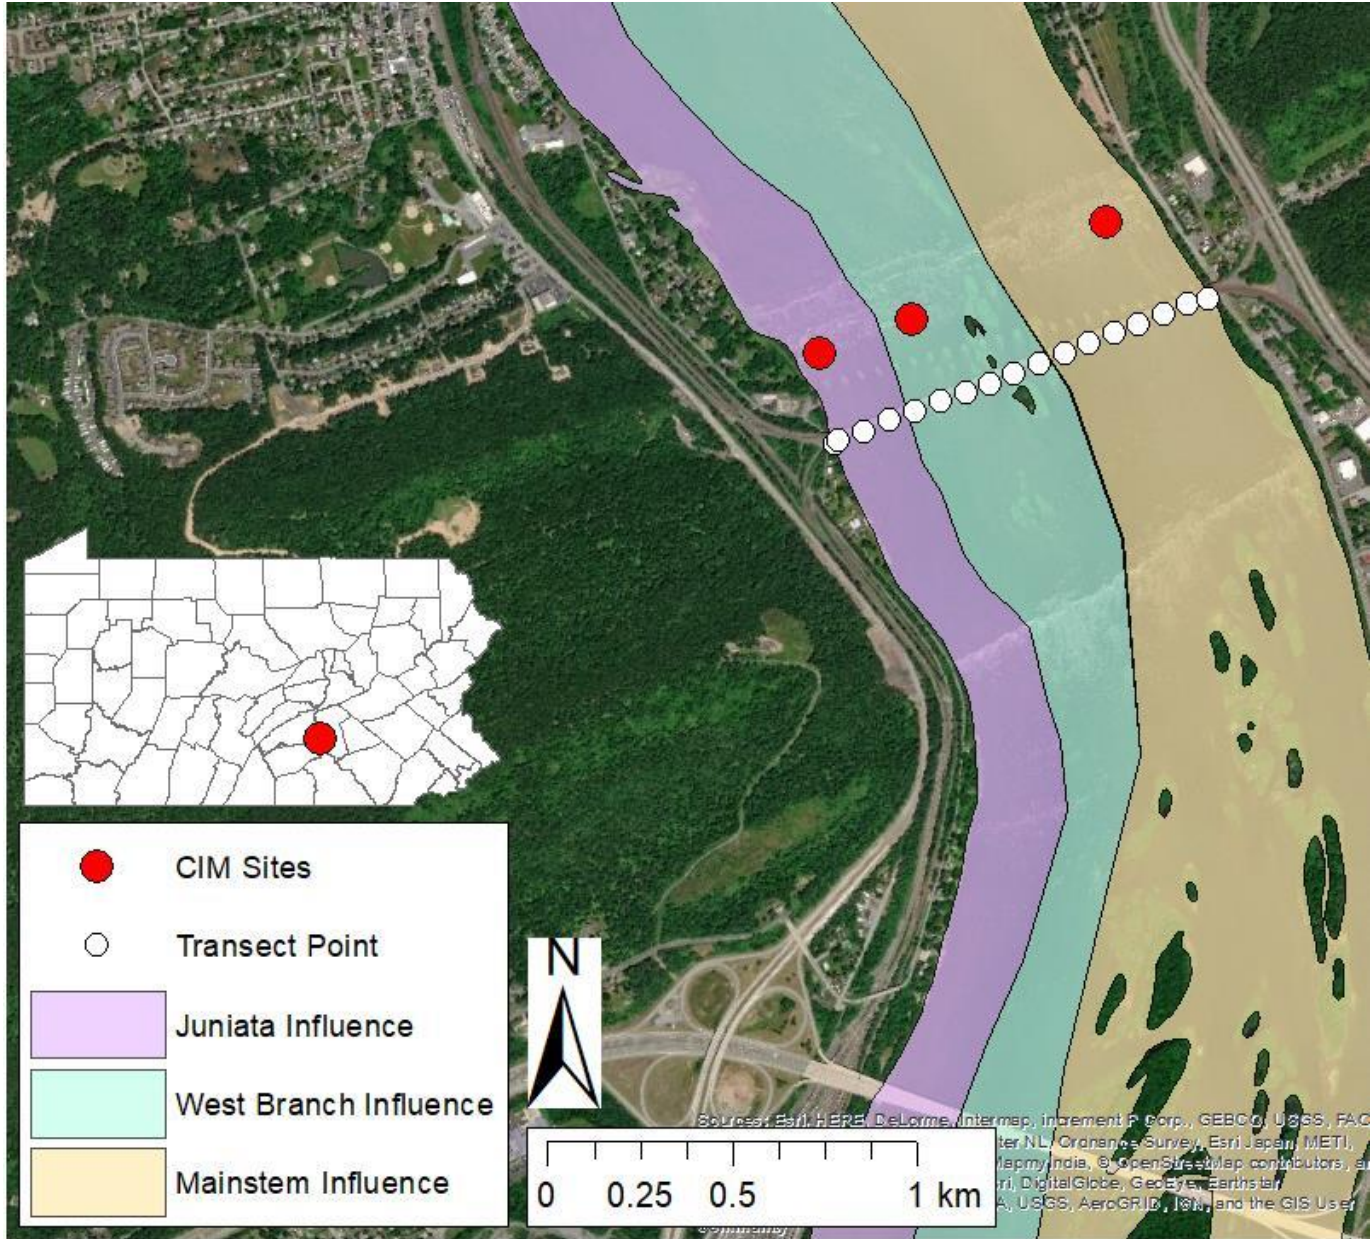

Delineating Spatial Extent

Delineating Spatial Extent

Delimiting Spatial Extent – Non-Mixed Rivers

Method Summary

1. Collect CIM data
2. QA procedures (corrections, transects, etc.)
3. Assessment decision
 - Count exceedances of criterion
 - Convert to percentage of a year
 - Not attaining if $> 1\%$ of a year
4. Determine spatial extent through discrete data
5. Characterize conditions for reference in future surveys or reassessments
